

To whom it may concern

RE: Securshock Security netting

Sutherland transport, Port Elizabeth, had been experiencing security issues and stock theft for quite some time, and it was becoming more and more difficult to find a solution. We were approached by Tarps & Canvas East London, Mr Clayton Heyns, who had developed a product to meet this requirement.

The product was designed and developed, and has been used on our trucks in effectively securing our cargo on our tautliner curtain-sider trucks. Assailants cannot retract cargo from the truck due to the steel netting prohibiting this also, the netting is energized by 8000volts, and the clear signage/warning thereof also deters them. There are other cargo netting security systems on the market but due to the fact that the Securshock is energized and clearly visible by signage/warnings, the assailants are hesitant and think twice.

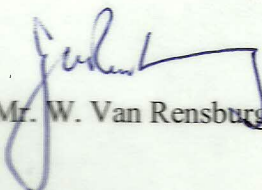

The Securshock netting is easily repairable and is interchangeable between curtains ie. netting is reusable. The energizer unit is installed in a cartridge form, making it convenient for a technician to access for repairs and maintenance.

The unit is armed/disarmed by simply flicking the park light switch inside the truck.

We highly recommend the Securshock product as we have been using it successfully. It has minimized interferences of our day to day business and there has there been a significant decrease in stock theft.

We believe that this new product and it's inroads into the transport sector, will have huge success as there is nothing of its kind on the market. Securshock provides effective security, and at the end of the day it's all about carrying the customer's load safely to it's destination!

All the best!

Mr. W. Van Rensburg
